Licensed Health Canada
Medical Device

How it Works:

When our tissue absorbs light from light-emitting diodes (LEDs), well-defined therapeutic benefits are generated. Light in the red and infrared spectrum has restorative, anti-inflammatory and healing properties. Specifically, light energy can increase blood flow, improve circulation and relieve pelvic pain.

vSculpt applies a controlled amount of gentle heat to the vaginal tissue. The heat increases blood flow, microcirculation, and collagen contraction and production, which restores elasticity and moisture to the vagina.

Therapeutic vibration helps tighten the muscles of the pelvic floor to increase muscle tone.

Our Photonic Gel supports the transfer of light into the tissue, while also making the device more comfortable to use.
